

SELF-HOSTED WEB ANALYTICS

Your whole dashboard. 151 milliseconds.

Twelve analytics queries over **1,000,000 events** — KPIs, top pages, traffic sources, funnels, campaigns — answered in less time than a single blink.

42 ms

Slowest single query at 1M events

100%

of queries under 50 ms

HOW IT WORKS

Two databases. Each doing what it's best at.

PostgreSQL · writes

Every tracked event lands here first. Durable, transactional, the system of record you already trust.

DuckDB · reads

A columnar engine running in-process. No network hop, no separate cluster to operate. Every dashboard query is answered here.

A background sync keeps them in step — so writes stay safe and reads stay fast.

AT 1,000,000 EVENTS

What each click costs you

Median database execution time, 30 runs each. No caching, no pre-computed rollups.

SCALING

10× the data. Still instant.

100,000 events

57 ms

full dashboard workload

1,000,000 events

151 ms

full dashboard workload

Ten times the events, well under three times the time. Columnar storage reads only the columns a query touches — so wide aggregations stay cheap as you grow.

NOT A MARKETING NUMBER

Run it yourself.

- ✓ Deterministic dataset — same seed, same rows, every machine
- ✓ 30 measured runs per query, median / p95 / p99 reported
- ✓ Results verified identical across both engines before timing
- ✓ Raw per-iteration samples published as JSON + CSV

```
npm run benchmark:engine -- --size 1000000 --seed 42
```

PostgreSQL 16.15

DuckDB v1.4.4

Apple M4

30 iterations

VERIFIED TWICE

**Same benchmark.
Two checkouts.
Same result.**

19.9 ms

Daily unique visitors — checkout A

19.4 ms

Daily unique visitors — checkout B

A benchmark you can't reproduce is a claim, not a measurement. We ran ours from two independent working copies and published both. The numbers land in the same place.

INSIGHTSTRACK

Fast analytics you actually own.

- ✓ Self-hosted — your data stays on your server
- ✓ No cookies, no fingerprinting, no stored IPs
- ✓ DNT & GPC opt-out honoured by default
- ✓ One script tag. Open source.

Privacy-friendly by design. Compliance still depends on your deployment — check your own requirements.
